FL-01: Workflow Audit

Name: Vivek Sharma
Course: AI Fluency — Framework & Foundations
Date: August 19, 2026

---

1. Purpose

This workflow audit maps my real weekly development and study activities to AI collaboration classifications. It identifies where AI can assist, where I must retain responsibility, and three specific target tasks for upcoming FL-02 through FL-04 work. The goal is to use AI effectively without becoming dependent on it for judgement, verification, or final decisions.

---

2. Weekly Workflow Audit

#	Recurring Task	Classification	Rationale
1	Python/C++ programming practice and learning	Collaborate with AI	AI can explain concepts, provide examples, and help debug, while I must understand and write the final solution.
2	DBMS and other technical subject revision	Delegate to AI with review	AI can create explanations, summaries, and practice questions, but I need to verify the technical content.
3	Debugging programming assignments and project code	Collaborate with AI	AI can identify bugs and suggest fixes, while I test the solution and understand the underlying problem.
4	Developing and improving my AI Video Restoration Pipeline	Collaborate with AI	AI can assist with architecture, debugging, optimization, and implementation, while I make the final engineering decisions.
5	Evaluating the actual visual quality of restored wedding/video footage	Just me	The final judgement about whether the restored footage looks genuinely better requires my own visual evaluation and project context.
6	Building and improving my personal/portfolio websites	Collaborate with AI	AI can suggest UI ideas and generate implementation code, while I decide the final design and user experience.
7	GitHub repository management and Git workflows	Collaborate with AI	AI can suggest commands and explain Git workflows, but I must control commits, branches, pushes, and potentially destructive operations.
8	Writing and improving README files and technical documentation	Delegate to AI with review	AI can draft and improve documentation quickly, while I verify that every technical statement matches the real project.

9	Preparing Python educational videos, scripts, and PPT content	Delegate to AI with review	AI can help structure explanations, scripts, and slides, but I need to verify technical correctness and teaching quality.
10	Exam preparation and study planning	Collaborate with AI	AI can create study plans, explanations, quizzes, and revision material, while I decide priorities and perform the actual studying.
11	Testing AI-generated code and verifying project changes	Collaborate with AI	AI can suggest test cases and checks, but I must run and evaluate the results before accepting changes.
12	Writing LinkedIn/project descriptions and portfolio content	Delegate to AI with review	AI can improve wording and structure, but I must verify that all claims accurately represent my actual work.
13	Making major technical/project direction decisions	Just me	Important architecture, project scope, and career-related technical decisions require my own judgement and responsibility.
14	Repetitive generation of project documentation/templates	Fully automate	Once the format and rules are defined, repetitive documentation generation can be handled automatically with scripts or AI workflows.

Summary: 14 tasks total — 7 Collaborate with AI, 4 Delegate to AI with review, 2 Just me, 1 Fully automate.

---

3. Three FL-02 to FL-04 Target Tasks

Target 1 — AI-Assisted Programming and Debugging

Task: Use AI to help understand programming concepts, debug C++/Python code, identify errors, suggest solutions, and improve implementations.

Role	Responsibilities
What AI does	Explain errors; suggest debugging approaches; generate small examples; suggest possible fixes; help identify edge cases; review code structure.
What I remain responsible for	Understanding the final solution; testing the code; checking correctness; making the final implementation decision; being able to explain the code without depending on AI.
Done well / success definition	The task is successful when the solution passes the required test cases, I can explain the implementation and reasoning myself, and every AI-generated change has been reviewed and understood before it is committed or submitted.

Target 2 — AI Video Restoration Pipeline Development

Task: Use AI assistance to develop, debug, optimize, and document my AI Video Restoration Pipeline.

Technologies: FFmpeg, PySceneDetect, OpenCLIP, Real-ESRGAN, InsightFace, ONNX Runtime, PyTorch, video/frame processing.

Role	Responsibilities
What AI does	Help debug errors; suggest architecture improvements; optimize code; explain libraries and algorithms; suggest performance improvements; help document the pipeline; review implementation decisions.
What I remain responsible for	Deciding whether a proposed change is appropriate; evaluating actual restoration quality; checking performance measurements; running tests; understanding the implementation; making final project decisions.
Done well / success definition	A pipeline change is successful when it is implemented without breaking existing functionality, relevant tests continue to pass, and the change produces a measurable improvement in processing performance, reliability, or restoration quality while I understand the reason for the improvement.

Target 3 — Technical Documentation and README Improvement

Task: Use AI to review, write, and improve README files and technical documentation for my projects.

Role	Responsibilities
What AI does	Review documentation structure; identify missing information; suggest clearer explanations; improve formatting; draft setup and usage instructions; identify unclear sections.
What I remain responsible for	Verifying technical accuracy; checking commands and file paths; confirming that described features actually exist; removing fabricated or incorrect claims; approving the final documentation.
Done well / success definition	Documentation is successful when another developer can understand the project's purpose and follow the setup/usage instructions without needing basic clarification, and all technical claims and commands match the actual repository.

---

4. Claude Project Configuration

Project Name: `Vivek — AI Fluency Workflow`

Custom Instructions

Who I Am

I am Vivek, a B.Tech CSE student and AI-assisted developer. I regularly work on programming, frontend development, AI/ML projects, GitHub repositories, technical documentation, educational content, and academic preparation.

One of my major projects is an AI Video Restoration Pipeline for restoring old wedding/video footage using modern computer vision and AI techniques.

Current Goals

- Improve my programming and software engineering skills.
- Become effective at AI-assisted development without becoming dependent on AI.
- Build strong real-world projects for my portfolio.
- Improve GitHub repositories and technical documentation.
- Learn concepts deeply enough to explain and maintain my own work.

- Use AI to reduce repetitive work while retaining responsibility for important decisions and verification.

Tone Preferences

- Be direct and practical.
- Explain technical concepts clearly.
- Avoid unnecessary filler.
- Point out mistakes directly.
- Give actionable steps for coding and project work.
- Never invent technical details, results, dependencies, or project claims.

AI Collaboration Rules

- Help me think, learn, debug, document, and build.
- Explain reasoning for important technical decisions.
- Treat AI-generated output as a draft until verified.
- Ask me to verify important assumptions when necessary.
- Clearly warn me before destructive Git operations or security-sensitive actions.
- Never fabricate project results or claim that an action was completed when it was not.

---

5. AI Tooling and Academy Evidence

Requirement	Status	Notes
ChatGPT account available	Evidence required	Screenshot or account confirmation not yet added to `evidence/`.
Claude account created/configured	Evidence required	Screenshot or account confirmation not yet added to `evidence/`.
Anthropic Academy account created	Evidence required	Enrollment screenshot not yet added to `evidence/`.
Enrolled in "AI Fluency: Framework & Foundations"	Evidence required	Enrollment confirmation not yet captured.
First module completed	Evidence required	Completion screenshot not yet added to `evidence/`.
Screenshot of configured Claude Project	Evidence required	Add as `evidence/claude-project-screenshot.png`.
Screenshot/evidence of Academy enrollment/completion	Evidence required	Add as `evidence/academy-completion.png`.

Evidence folder: `FL-01/evidence/` — ready for manual screenshot upload. No placeholder or fabricated images have been included.

---

6. Submission Checklist

- ☑ 10+ genuine personal tasks (14 tasks documented)
- ☑ Every task classified
- ☑ Every task has a rationale
- ☑ At least two "Just me" tasks (Tasks 5 and 13)

- [x] Three target tasks selected
- [x] All three have measurable success definitions
- [x] Claude Project configured *(documented; screenshot evidence required)*
- [ ] Claude Project screenshot captured
- [ ] ChatGPT/Claude/Academy evidence captured
- [ ] AI Fluency first module completed
- [x] Final PDF created
- [x] PDF uploaded to GitHub
- [ ] Evidence screenshots added to GitHub
- [x] Final changes committed and pushed

End of FL-01 Workflow Audit
